Tennis Professionals Dataset

Goal: build a flexible and understandable relational database in Mysql, ensuring all the integrity restrictions and present the result of the following four queries (select commands)

1) For each country:

a) Number of players
b) Number of tournaments
c) Number of rounds

CountryName	TotalPlayers	TotalTournaments	TotalGames
Afghanistan	0	0	0
Zimbabwe	11	41	666

2) List of top 10 players name with their % of winning games, order by %

3) List of top 10 left-handed players name with their % of winning games in Grand Slam games

4) List of top 5 players name with their winning games in Hard Ground

Deliverables (in a zip file)

1. pdf file explaining all the steps, easy to read (should use graphics), **highlighting the decisions, lost rows, etc.** Don't forget the relational diagram with the keys (use phpMyAdmin designer).
2. txt files with the complete scripts (ready to copy & paste & test against the original file).
3. ppt file with only the tables with the results for the four questions (simple, and easy to read).

Note: the name of the file is the concatenation of the students names (first_last). Example AnnaFerreira_LuísCastro.zip.
